COMPUTER AIDED TEST PREPARATION

Abstract of the Disclosure

A system and method for computer aided test preparation is disclosed. A user submits a weighted answer in response to a test preparation question displayed on a computer display screen. The system and method use the weight of the response to determine the frequency of repetition of that particular question in the user's subsequent test preparation activities. The weight may be an indication of the user's confidence level of his or her submitted response being the correct response to each question.
